Correct use of AI in college

As technology has advanced over the years drastically, AI has become a worldwide tool that is helpful to many people. Students specifically, become very dependent on AI as it has been normalized in today's society. As a student, AI can be used as a beneficial tool to break down information, understand complex concepts, create useful study habits and much more. But there is a correct way about using AI as a student and it should not be abused for a student to be dependent on. Use AI as a starting point or a guidance in your learning and make yourself accountable in learning the criteria as AI isn't always in front of you in the real world.

AI- "Do you agree or disagree on my reasoning, why or why not?"

Yes, I agree with your reasoning because you recognize that AI can be a valuable learning tool, but students should not become so dependent on it that they stop developing their own knowledge and skills. I especially agree with your point that AI should be used as a starting point or guide rather than a replacement for learning. AI can help students break down complex concepts, brainstorm ideas, and develop study strategies, but students still need to understand the material themselves so they can apply what they learn in exams, future careers, and real-world situations. One additional perspective is that using AI responsibly also means checking its accuracy, since it can provide incorrect or misleading information. Overall, your reasoning is strong because you acknowledge both the benefits and risks of AI while emphasizing the importance of independent thinking and personal accountability.

Incorrect use of AI in college

In today's world, we are in a fast evolving society where convenience is highly valued.Students often abuse the usage of artificial intelligence by skipping the important learning stage and submitting the material generated by artificial intelligence as their own unique work. Instead of dealing with challenging content, many students use generative tools to discreetly complete individual assignment questions on their phones or generate essays in seconds. This shortcut significantly delays the development of independent problem solving skills, and lessens their overall ability to be patient and focused.

AI- "Do you agree or disagree on my reasoning, why or why not?"

I agree with your reasoning because you explain how students can misuse AI by prioritizing convenience over actually learning the material. When students submit AI-generated work as their own without understanding or contributing to it, they miss opportunities to develop critical thinking, problem-solving, and writing skills. I also agree

with your point that constantly relying on AI for immediate answers can make it more difficult for students to work through challenging assignments independently. However, I think it is important to recognize that using AI to help explain difficult concepts or provide feedback is not necessarily misuse, as long as students follow their instructors' guidelines and complete their own learning. Overall, your paragraph makes a strong argument that the problem is not AI itself, but how students choose to use it.
